

June 1993 Revised March 1999

#### 74LVX373

# **Low Voltage Octal Transparent Latch with 3-STATE Outputs**

#### **General Description**

The LVX373 consists of eight latches with 3-STATE outputs for bus organized system applications. The latches appear transparent to the data when Latch Enable (LE) is HIGH. When LE is LOW, the data satisfying the input timing requirements is latched. Data appears on the bus when the Output Enable  $(\overline{\text{OE}})$  is LOW. When  $\overline{\text{OE}}$  is HIGH, the bus

output is in the high impedance state. The inputs tolerate up to 7V allowing interface of 5V systems to 3V systems.

#### **Features**

- Input voltage translation from 5V to 3V
- Ideal for low power/low noise 3.3V applications

#### **Ordering Code:**

|                 | Order Number | Package Number | Package Description   |
|-----------------|--------------|----------------|---|
| 74LVX373M M20B  |              |                | 20-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide  |
| 74LVX373SJ M20D |              | M20D           | 20-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide               |
|                 | 74LVX373MTC  | MTC20          | 20-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide |

Devices also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

#### **Logic Symbols**

#### **Connection Diagram**

#### **Pin Descriptions**

| Pin Names                      | Description           |  |  |  |
|--------------------------------|-----------------------|--|--|--|
| D <sub>0</sub> -D <sub>7</sub> | Data Inputs           |  |  |  |
| LE                             | Latch Enable Input    |  |  |  |
| ŌE                             | Output Enable Input   |  |  |  |
| O <sub>0</sub> -O <sub>7</sub> | 3-STATE Latch Outputs |  |  |  |

#### **Functional Description**

The LVX373 contains eight D-type latches with 3-STATE standard outputs. When the Latch Enable (LE) input is HIGH, data on the D<sub>n</sub> inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The 3-STATE standard outputs are controlled by the Output Enable (OE) input. When OE is LOW, the standard outputs are in the 2-state mode. When  $\overline{\text{OE}}$  is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the latches.

#### **Truth Table**

|    | Inputs |                |                |  |  |  |  |
|----|--------|----------------|----------------|--|--|--|--|
| LE | OE     | D <sub>n</sub> | O <sub>n</sub> |  |  |  |  |
| Х  | Н      | Х              | Z              |  |  |  |  |
| Н  | L      | L              | L              |  |  |  |  |
| Н  | L      | Н              | Н              |  |  |  |  |
| L  | L      | Х              | $O_0$          |  |  |  |  |

H = HIGH Voltage Level

L = LOW Voltage Level Z = High Impedance X = Immaterial

O<sub>0</sub> = Previous O<sub>0</sub> before HIGH-to-LOW transition of Latch Enable

#### **Logic Diagram**

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

#### **Absolute Maximum Ratings**(Note 1)

Supply Voltage ( $V_{CC}$ ) -0.5V to +7.0V

DC Input Diode Current (I<sub>IK</sub>)

 $V_{l} = -0.5 \text{V} \\ \text{DC Input Voltage (V}_{l}) \\ -0.5 \text{V to 7V} \\ \end{array}$ 

DC Output Diode Current (I<sub>OK</sub>)

 $\begin{aligned} \text{V}_{\text{O}} &= -0.5 \text{V} & -20 \text{ mA} \\ \text{V}_{\text{O}} &= \text{V}_{\text{CC}} + 0.5 \text{V} & +20 \text{ mA} \end{aligned}$ 

DC Output Voltage ( $V_{O}$ ) -0.5V to  $V_{CC} + 0.5V$ 

DC Output Source

or Sink Current (I<sub>O</sub>) ±25 mA

DC V<sub>CC</sub> or Ground Current

 $\begin{array}{c} ({\rm I_{CC}~or~I_{GND}}) & \pm 75~{\rm mA} \\ \\ {\rm Storage~Temperature~(T_{STG})} & -65^{\circ}{\rm C~to~+150^{\circ}C} \end{array}$ 

Power Dissipation 180 mW

## Recommended Operating Conditions (Note 2)

Supply Voltage ( $V_{CC}$ ) 2.0V to 3.6V Input Voltage ( $V_{I}$ ) 0V to 5.5V Output Voltage ( $V_{O}$ ) 0V to  $V_{CC}$ 

Operating Temperature (T<sub>A</sub>)  $-40^{\circ}\text{C}$  to +85°C Input Rise and Fall Time ( $\Delta t/\Delta V$ ) 0 ns/V to 100 ns/V

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions

Note 2: Unused inputs must be held HIGH or LOW. They may not float.

for actual device operation.

|                   |                                  | $3.3\pm0.3$         | 1.0                    |      |   | 1.0 |       | 115        |  |
| t <sub>OSLH</sub> | Output to Output Skew            | 2.7                 |                        |      | 1.5   |     | 1.5   | ns         | C <sub>L</sub> = 50 pF                         |
| t <sub>OSHL</sub> | (Note 4)                         | 3.3                 |                        |      | 1.5   |     | 1.5   | 115        |  |

Note 4: Parameter guaranteed by design.  $t_{OSLH} = |t_{PLHm} - t_{PLHn}|, t_{OSHL} = |t_{PHLm} - t_{PHLn}|$ 

#### Capacitance

| Symbol           | ol Parameter         |     | T <sub>A</sub> = +25°C |     | T <sub>A</sub> = -40°0 | Units |        |
|------------------|----------------------|-----|------------------------|-----|------------------------|-------|--------|
| Symbol           |                      | Min | Тур                    | Max | Min                    | Max   | Offics |
| C <sub>IN</sub>  | Input Capacitance    |     | 4                      | 10  |                        | 10    | pF     |
| C <sub>OUT</sub> | Output Capacitance   |     | 6                      |     |                        |       | pF     |
| C <sub>PD</sub>  | Power Dissipation    |     | 27                     |     |                        |       | pF     |
|                  | Capacitance (Note 5) |     |                        |     |                        |       |        |

Note 5: C<sub>PD</sub> is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation:  $I_{CC(opr.)} = \frac{C_{PD} \times V_{CC} \times f_{|N} + I_{CC}}{8 \text{ (per Latch)}}$

#### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
