# 74VCXH16374 Low Voltage 16-Bit D-Type Flip-Flop with Bushold

### **General Description**

FAIRCHILD

SEMICONDUCTOR

The VCXH16374 contains sixteen non-inverting D-type flipflops with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. A buffered clock (CP) and output enable ( $\overline{OE}$ ) are common to each byte and can be shorted together for full 16-bit operation.

The VCXH16374 data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating data inputs at a valid logic level.

The 74VCXH16374 is designed for low voltage (1.65V to 3.6V)  $\rm V_{CC}$  applications with output compatibility up to 3.6V.

The 74VCXH16374 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

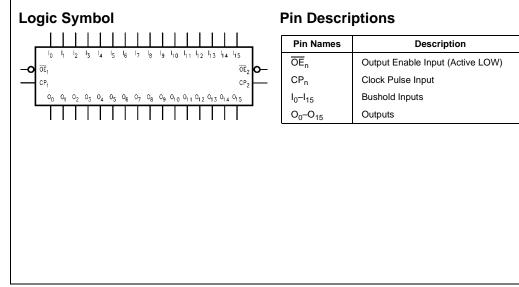

### Features

- 1.65V–3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant control inputs and outputs
- Bushold on data inputs eliminates the need for external pull-up/pull-down resistors
- t<sub>PD</sub>
  - 3.0 ns max for 3.0V to 3.6V V<sub>CC</sub> 3.9 ns max for 2.3V to 2.7V V<sub>CC</sub>
  - 7.8 ns max for 1.65V to 1.95V V<sub>CC</sub>
- Static Drive (I<sub>OH</sub>/I<sub>OL</sub>)
  ±24 mA @ 3.0V V<sub>CC</sub>
  ±18 mA @ 2.3V V<sub>CC</sub>
  - ±6 mA @ 1.65V V<sub>CC</sub>
- Uses patented noise/EMI reduction circuitry
- Latch-up performance exceeds 300 mA
- ESD performance:
- Human body model > 2000V Machine model > 200V

### **Functional Description**

The 74VCXH16374 consists of sixteen edge-triggered flipflops with individual D-type inputs and 3-STATE true outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. Each clock has a buffered clock and buffered Output Enable common to all flip-flops within that byte. The description which follows applies to each byte. Each flip-

the setup and hold time requirements on the LOW-to-HIGH Clock  $(\overline{OP}_n)$  transition. With the Output Enable  $(\overline{OE}_n)$  LOW, the contents of the flip-flops are available at the outputs. When  $\overline{OE}_n$  is HIGH, the outputs go to the high impedance state. Operations of the  $\overline{OE}_n$  input does not affect the state of the flip-flops.
