256K x 32, 256K x 36, 512K x 18 8Mb SYNCBURST Flow throughSRAMs

FEATURES

- Flowthrough Mode operation.
- User-selectable Output Drive Strength with XQ Mode.
- Internal self-timed write cycle
- Individual Byte Write Control and Global Write
- Clock controlled, registered address, data and control
- Pentium™ or linear burst sequence control using MODE input
- Common data inputs and data outputs
- JEDEC 100-Pin TQFP and 119-pin PBGA package
- Single +3.3V, +10%, -5% core power supply
- Power-down snooze mode
- 2.5V or 3.3V I/O Supply
- Snooze MODE for reduced-power standby
- T version (three chip selects)
- D version (two chip selects)

DESCRIPTION

ICSI's 8Mb SyncBurst Flowthrough SRAMs integrate a 512k x 18, 256k x 32, or 256k x 36 SRAM core with advanced synchronous peripheral circuitry and a 2-bit burst counter.

Applications

The ICSI SyncBurst Flowthrough SRAM family employs high-speed, low-power CMOS designs that are fabricated using an advanced CMOS process to provide Level 2 Cache applications supporting Pentium and PowerPC microprocessors originally, the device now finds application ranging from DSP main store to networking chip set support.

Controls

All synchronous inputs pass through registers controlled by a positive-edge-triggered single clock input. Bursts can be initiated with either ADSP (Address Status Processor) or ADSC (Address Status Cache Controller) input pins. Subsequent burst addresses can be generated internally and controlled by the ADV (burst address advance) input pin. The mode pin is used to select the burst sequence order, Linear burst is achieved when this pin is tied LOW. Interleave burst is achieved when this pin is tied HIGH or left floating.

Byte Write and Global Write

Write cycles are internally self-timed and are initiated by the rising edge of the clock input. Write cycles can be from one to four bytes wide as controlled by the write control inputs. Separate byte enables allow individual bytes to be written. Byte write operation is performed by using byte write enable (\overline{BWE}) input combined with one or more individual byte write signals (\overline{BWx}). In addition, Global Write (\overline{GW}) is available for writing all bytes at one time, regardless of the byte write controls.

IOL/IOH Drive strength Options

The XQ pin allows selection between high drive strength (XQ low) for multi-drop bus applications and normal drive strength (XQ floating or high) point-to-point applications. See the Output Driver Characteristics chart for details.

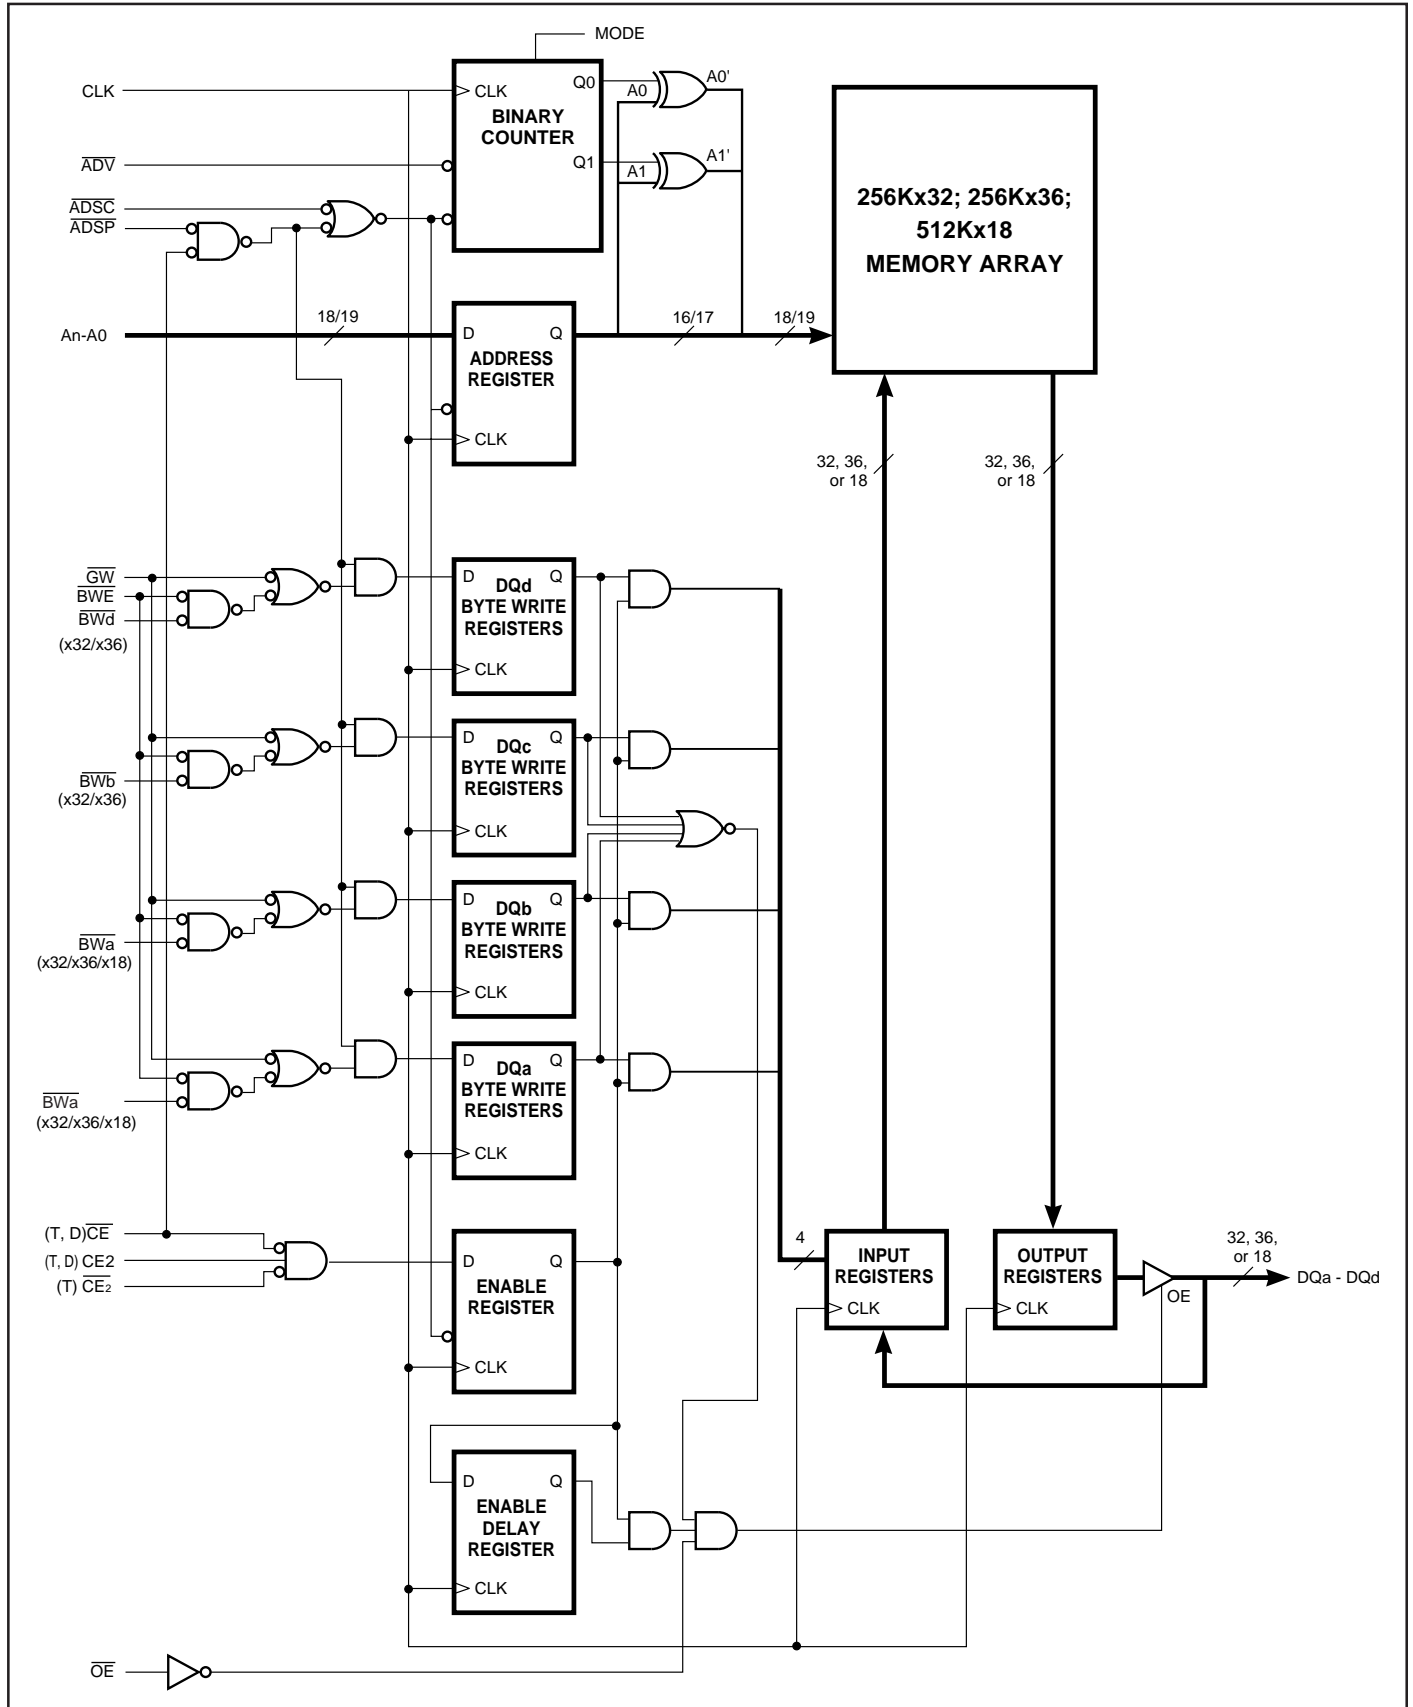

Snooze Mode

Low power (Snooze mode) is attained through the assertion (High) of the ZZ signal, or by stopping the clock (CK). Memory data is retained during Snooze mode.

Notes:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, precautions may be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.
3. This device contains circuitry that will ensure the output devices are in High-Z at power up.
