

Low Skew Fan Out Buffers

General Description

The ICS9179-03 generates low skew clock buffers required for high speed RISC or CISC microprocessor systems such as Intel PentiumPro. Outputs will handle up to 133MHz clocks. An output enable is provided for testability.

The device is a buffer with low output to output skew. This is a Fanout buffer device, not using an internal PLL. This buffer can also be a feedback to an external PLL stage for phase synchronization to a master clock. There are a total of ten outputs, sufficient for feedback to a PLL source and to drive four small outline DIMM modules (S.O. DIMM) at 2 clocks each. Or a total of ten outputs as a Fanout buffer from a common clock source.

The individual clock outputs are addressable through I²C to be enabled, or stopped in a low state for reduced EMI when the lines are not needed.

Features

- Ten High speed, low noise non-inverting buffers for (to 133MHz), clock buffer applications.
- Output slew rate faster than 1.5V/ns into 20pF
- Supports up to four small outline DIMMS (S.O. DIMM).
- Synchronous clocks skew matched to 250 ps window on OUTPUTs(0:9).
- I²C Serial Configuration interface to allow individual OUTPUTs to be stopped low.
- Multiple VDD, VSS pins for noise reduction
- Tri-state pin for testing
- 3.0V – 3.7V supply range
- 28-pin (209 mil) SSOP and (6.1mm) TSSOP package

16	GNDI	PWR	Ground for I ² C circuitry and internal logic

Notes:

1. At power up all ten OUTPUTs are enabled and active.
2. OE has a 100K Ohm internal pull-up resistor to keep all outputs active.
3. The SDATA and SCLK inputs both also have internal pull-up resistors with values above 100K Ohms as well for complete platform flexibility.

VDD(0:5), GND(0:5) = Power supply for OUTPUT buffer

VDDI, GNDI = Power supply for I²C circuitry

Technical Pin Function Descriptions

VDD

This is the power supply to the internal core logic of the device as well as the clock output buffers for OUTPUT (0:9).

This pin operates at 3.3V volts. Clocks from the listed buffers that it supplies will have a voltage swing from Ground to this level. For the actual guaranteed high and low voltage levels for the Clocks, please consult the DC parameter table in this data sheet.

GND

This is the power supply ground (common or negative) return pin for the internal core logic and all the output buffers.

OUTPUT (0:9)

These Output Clocks are used to drive Dynamic RAM's and are low skew copies of the CPU Clocks. The voltage swing of the OUTPUTs output is controlled by the supply voltage that is applied to VDD of the device, operates at 3.3 volts.

I²C

The SDATA and SCLOCK Inputs are used to program the device. The clock generator is a slave-receiver device in the I²C protocol. It will allow read-back of the registers. See configuration map for register functions. The I²C specification in Philips I²C Peripherals Data Handbook (1996) should be followed.

BUF_IN

Input for Fanout buffers (OUTPUT 0:9).

OE

OE tristates all outputs when held low.

VDD1

This is the power supply to I²C circuitry.

General I²C serial interface information

The information in this section assumes familiarity with I²C programming.
For more information, contact ICS for an I²C programming application note.

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2_(H)
- ICS clock will **acknowledge**
- Controller (host) sends a dummy command code
- ICS clock will **acknowledge**
- Controller (host) sends a dummy byte count
- ICS clock will **acknowledge**
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will **acknowledge** each byte *one at a time*.
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D3_(H)
- ICS clock will **acknowledge**
- ICS clock will send the **byte count**
- Controller (host) acknowledges
- ICS clock sends first byte (**Byte 0**) through **byte 6**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

Notes:

1. The ICS clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol.**
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I²C interface, the protocol is set to use only "Block-Writes" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

Note2: Duty cycle of input clock is 47.5% to 52.5%. Input edge rate is for propagation delay ≥ 1V/ns

General Layout Precautions:

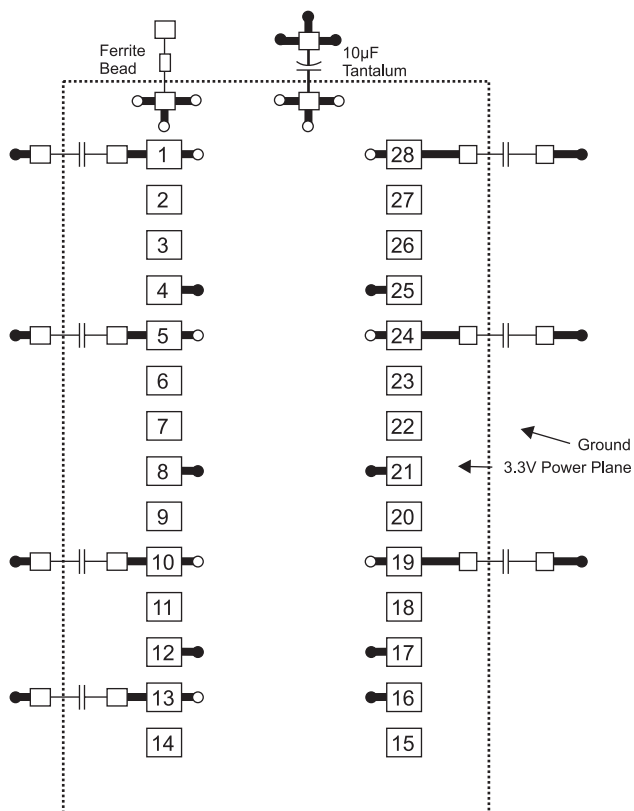

- 1) Use a ground plane on the top layer of the PCB in all areas not used by traces.
- 2) Make all power traces and vias as wide as possible to lower inductance.

Notes:

- 1 All clock outputs should have series terminating resistor. Not shown in all places to improve readability of diagram
- 2 Optional EMI capacitor should be used on all CPU, SDRAM, and PCI outputs.

Capacitor Values:

All unmarked capacitors are 0.01 μ F ceramic
