#### FEATURES

- Wide supply voltage range of 1.2 V to 3.6 V
- Complies with JEDEC standard no. 8-1A
- CMOS low power consumption
- MULTIBYTE<sup>TM</sup> flow-through standard pin-out architecture
- Low inductance multiple V<sub>CC</sub> and ground pins for minimum noise and ground bounce
- Direct interface with TTL levels
- Bus hold on all data inputs eliminates the need for external pull-up resistors to hold unused inputs
- Output drive capability 50Ω transmission lines @ 85°C

#### DESCRIPTION

The 74ALVCH16540 is a high-performance, low-power, low-voltage, Si-gate CMOS device, superior to most advanced CMOS compatible TTL families.

The 74ALVCH16540 is a 16-bit inverting buffer/line driver with 3-State outputs. The 3-State outputs are controlled by the output enable inputs  $1\overline{OE}_n$  and  $2\overline{OE}_n$ . A HIGH on  $n\overline{OE}_n$  causes the outputs to assume a high impedance OFF-state.

Active bus hold circuitry is provided to hold unused or floating data inputs at a valid logic level. This feature eliminates the need for external pull-up or pull-down resistors. The device can be used as four 4-bit buffers, two 8-bit buffers or one 16-bit buffer.

#### NOTES:

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in  $\mu$ W):

 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma \ (C_L \times V_{CC}^2 \times f_o) \ \text{where:}$   $f_i = \text{input frequency in MHz; } C_L = \text{output load capacitance in pF;}$ 

 $f_o$  = output frequency in MHz;  $V_{CC}$  = supply voltage in V;

 $\Sigma$  (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>0</sub>) = sum of outputs.

NOTES:

 Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
