description

The TMS320C44 DSP is a 32-bit, floating-point processor manufactured in 0.72- μ m double-level-metal CMOS technology. The TMS320C44 is part of the TMS320C4x generation of DSPs from Texas Instruments. The on-chip parallel-processing capabilities of the C44 make the immense floating-point performance required by many applications achievable.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

[†] IEEE Standard 1149.1–1990 Standard Test-Access Port and Boundary-Scan Architecture.

EPIC and TI are trademarks of Texas Instruments.

All trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

operation

The C44 has four on-chip communication ports for processor-to-processor communication with no external hardware and simple communication software. This allows connectivity with no external-glue logic. The communication ports remove input/output bottlenecks, and the independent smart 6-channel DMA coprocessor is able to handle the CPU input/output burden.

To fit the C40 into a 304-pin PQFP package (thermally enhanced plastic quad flatpack), two communication ports are removed and the external local and global address buses are reduced to 24 address lines each. In this case, both the bond pads and driver circuits are removed, decreasing die size and power consumption. Otherwise, functionality remains the same as the rest of the C4x family.

The communication-port token and data-strobe control lines are internally connected to avoid spurious data, boot-up, and power consumption problems.

functions

This section lists signal descriptions for the C44 device: each signal, number of pins, operating mode(s) (that is, input, output, or high-impedance state as indicated by I, O, or Z, respectively), and function. The signals are grouped according to function.

Pin Functions

SIGNAL NAME	NO. OF PINS	TYPE†	DESCRIPTION
GLOBAL-BUS EXTERNAL INTERFACE (73 pins)			
D31 – D0	32	I/O/Z	32-bit data port of the global-bus external interface
DE	1	I	Data-bus-enable signal for the global-bus external interface
A23 – A0	24	O/Z	24-bit address port of the global-bus external interface
AE	1	I	Address-bus-enable signal for the global-bus external interface
STAT3 – STAT0	4	O	Status signals for the global-bus external interface
LOCK	1	O	Lock signal for the global-bus external interface
STRB0‡	1	O/Z	Access strobe 0 for the global-bus external interface
R/W0‡	1	O/Z	Read/write signal for STRB0 accesses
PAGE0‡	1	O/Z	Page signal for STRB0 accesses
RDY0‡	1	I	Ready signal for STRB0 accesses
CE0‡	1	I	Control enable for the STRB0, PAGE0, and R/W0 signals
STRB1‡	1	O/Z	Access strobe 1 for the global-bus external interface
R/W1‡	1	O/Z	Read/write signal for STRB1 accesses
PAGE1‡	1	O/Z	Page signal for STRB1 accesses
RDY1‡	1	I	Ready signal for STRB1 accesses
CE1‡	1	I	Control enable for the STRB1, PAGE1, and R/W1 signals
LOCAL-BUS EXTERNAL INTERFACE (73 pins)			
LD31 – LD0	32	I/O/Z	32-bit data port of the local-bus external interface
LDE	1	I	Data-bus-enable signal for the local-bus external interface
LA23 – LA0	24	O/Z	24-bit address port of the local-bus external interface
LAE	1	I	Address-bus-enable signal for the local-bus external interface
LSTAT3 – LSTAT0	4	O	Status signals for the local-bus external interface
LLOCK	1	O	Lock signal for the local-bus external interface

† I = input, O = output, Z = high impedance

‡ The effective address range is defined by the local/global STRB ACTIVE bits in the memory interface-control registers.

Pin Functions (Continued)

SIGNAL NAME	NO. OF PINS	TYPE†	DESCRIPTION
LOCAL-BUS EXTERNAL INTERFACE (73 pins) (Continued)			
$\overline{\text{LSTRB0}}^\ddagger$	1	O/Z	Access strobe 0 for the local-bus external interface
LR/ $\overline{\text{W0}}$	1	O/Z	Read/write signal for $\overline{\text{LSTRB0}}$ accesses
LPAGE0	1	O/Z	Page signal for $\overline{\text{LSTRB0}}$ accesses
$\overline{\text{LRDY0}}$	1	I	Ready signal for $\overline{\text{LSTRB0}}$ accesses
$\overline{\text{LCE0}}$	1	I	Control enable for the $\overline{\text{LSTRB0}}$, LPAGE0, and LR/ $\overline{\text{W0}}$ signals
$\overline{\text{LSTRB1}}^\ddagger$	1	O/Z	Access strobe 1 for the local-bus external interface
LR/ $\overline{\text{W1}}$	1	O/Z	Read/write signal for $\overline{\text{LSTRB1}}$ accesses
LPAGE1	1	O/Z	Page signal for $\overline{\text{LSTRB1}}$ accesses
$\overline{\text{LRDY1}}$	1	I	Ready signal for $\overline{\text{LSTRB1}}$ accesses
$\overline{\text{LCE1}}$	1	I	Control enable for the $\overline{\text{LSTRB1}}$, LPAGE1, and LR/ $\overline{\text{W1}}$ signals
COMMUNICATION PORT 1 INTERFACE (13 pins)			
C1D7–C1D0	8	I/O	Communication port 1 data bus
$\overline{\text{CREQ1}}$	1	I/O	Communication port 1 token-request signal
$\overline{\text{CACK1}}$	1	I/O	Communication port 1 token-request-acknowledge signal
$\overline{\text{CSTRB1}}$	1	I/O	Communication port 1 data-strobe signal
$\overline{\text{CRDY1}}$	1	I/O	Communication port 1 data-ready signal
CDIR1	1	O	Communication port 1 direction signal
COMMUNICATION PORT 2 INTERFACE (13 pins)			
C2D7–C2D0	8	I/O	Communication port 2 data bus
$\overline{\text{CREQ2}}$	1	I/O	Communication port 2 token-request signal
$\overline{\text{CACK2}}$	1	I/O	Communication port 2 token-request-acknowledge signal
$\overline{\text{CSTRB2}}$	1	I/O	Communication port 2 data-strobe signal
$\overline{\text{CRDY2}}$	1	I/O	Communication port 2 data-ready signal
CDIR2	1	O	Communication port 2 direction signal
COMMUNICATION PORT 4 INTERFACE (13 pins)			
C4D7–C4D0	8	I/O	Communication port 4 data bus
$\overline{\text{CREQ4}}$	1	I/O	Communication port 4 token-request signal
$\overline{\text{CACK4}}$	1	I/O	Communication port 4 token-request-acknowledge signal
$\overline{\text{CSTRB4}}$	1	I/O	Communication port 4 data-strobe signal
$\overline{\text{CRDY4}}$	1	I/O	Communication port 4 data-ready signal
CDIR4	1	O	Communication port 4 direction signal
COMMUNICATION PORT 5 INTERFACE (13 pins)			
C5D7–C5D0	8	I/O	Communication port 5 data bus
$\overline{\text{CREQ5}}$	1	I/O	Communication port 5 token-request signal
$\overline{\text{CACK5}}$	1	I/O	Communication port 5 token-request-acknowledge signal
$\overline{\text{CSTRB5}}$	1	I/O	Communication port 5 data-strobe signal
$\overline{\text{CRDY5}}$	1	I/O	Communication port 5 data-ready signal
CDIR5	1	O	Communication port 5 direction signal

† I = input, O = output, Z = high impedance

‡ The effective address range is defined by the local/global STRB ACTIVE bits in the memory interface-control registers.

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

Pin Functions (Continued)

SIGNAL NAME	NO. OF PINS	TYPE†	DESCRIPTION
INTERRUPTS, I/O FLAGS, RESET, TIMER (12 pins)			
IIOF3 – IIOF0	4	I/O	Interrupt and I/O flags
NMI	1	I	Nonmaskable interrupt. $\overline{\text{NMI}}$ is sensitive to a low-going edge.
IACK	1	O	Interrupt acknowledge
RESET	1	I	Reset signal
RESETLOC1 RESETLOC0	2	I	Reset-vector location
ROMEN	1	I	On-chip ROM enable (0 = disable, 1 = enable)
TCLK0	1	I/O	Timer 0
TCLK1	1	I/O	Timer 1
CLOCK (4 pins)			
X1	1	O	Crystal
X2 / CLKIN	1	I	Crystal/oscillator
H1	1	O	H1 clock
H3	1	O	H3 clock
POWER (71 pins)			
CV _{SS}	17	I	Ground
DV _{SS}	17	I	Ground
IV _{SS}	6	I	Ground
DV _{DD}	22	I	5-V _{DC} supply
VSUBS	1	I	Substrate (tie to ground)
V _{DDL}	4	I	5-V _{DC} supply
V _{SSL}	4	I	Ground
EMULATION (7 pins)			
TCK	1	I	IEEE 1149.1 test port clock
TDI	1	I	IEEE 1149.1 test port data in
TDO	1	O/Z	IEEE 1149.1 test port data out
TMS	1	I	IEEE 1149.1 test port mode select
$\overline{\text{TRST}}$	1	I	IEEE 1149.1 test port reset
EMU0	1	I/O	Emulation pin 0
EMU1	1	I/O	Emulation pin 1

† I = input, O = output, Z = high impedance

‡ The effective address range is defined by the local/global STRB ACTIVE bits in the memory interface-control registers.

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

block diagram

Continued on next page

block diagram (continued)

† Communication ports 0 and 3 are not connected.

memory aliasing

The C44 offers global and local addresses of A0–A23 and LA0–LA23, giving an external address reach of $(2 \text{ buses}) \times (2^{24}) = 2^{25}$ words. Since the internal address span of the C44 is 2^{32} words, reading or writing to memory outside of the base-address region causes memory aliasing. Figure 2 shows how the memory pages overlap each other.

Figure 2. Memory Alias

central processing unit

The C44 CPU is configured for high-speed internal parallelism for the highest sustained performance. The key features of the CPU are:

- Eight operations/cycle:
 - 40-/32-bit floating-point/integer multiply
 - 40-/32-bit floating-point/integer ALU operation
 - Two data accesses
 - Two address-register updates
- Floating-point conversion
- Divide and square-root support
- C3x and C4x assembly-language compatibility
- Byte and halfword accessibility

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

DMA coprocessor

The DMA coprocessor allows concurrent I/O and CPU processing for the highest sustained CPU performance. The key features of the DMA coprocessor are:

- Link pointers to allow DMA channels to autoinitialize without CPU intervention
- Parallel CPU operation and DMA transfers
- Six DMA channels to support memory-to-memory data transfers
- Split-mode operation which doubles the available channels to twelve when data transfers to and from a communication port are required

communication ports

The C44 contains four identical high-speed communication ports, each of which provides a bidirectional-communication interface to other C4x devices and external peripherals. The key features of the communication ports are:

- Direct interprocessor communication and processor I/O
- 20M-byte/s bidirectional interface on each communication port for high-speed multiprocessor interface
- Port direction pin (CDIR) to ease interfacing
- Separate input and output 8-word-deep FIFO buffers for processor-to-processor communication and I/O
- Automatic arbitration and handshaking for direct processor-to-processor connection

communication-port direction pin

A port-direction pin (CDIR1, CDIR2, CDIR4, CDIR5) is available for each C44 communication port. When the communication port is in the output mode, CDIRx is driven low. When the communication port is in the input mode, CDIRx is driven high. The truth table for two C44 devices is shown in Table 1. Communication port 1 of CPUA is connected to communication port 4 of CPUB.

Table 1. Truth Table for Two C44 Devices

CDIR1	CDIR4	DESCRIPTION
0	0	Token error
0	1	CPUA is configured to transmit to CPUB.
1	0	CPUB is configured to transmit to CPUA.
1	1	Token exchange overlap, if > 1H then token error

communication-port-software reset

The input and output FIFO levels for a communication port can be flushed by writing at least two back-to-back values to its communication-port software-reset address as specified in Table 2. This software reset flushes any word or byte already present in the FIFOs, but it does not affect the status of the communication-port pins.

Table 2. Communication-Port Software-Reset Address

COMMUNICATION PORT	SOFTWARE-RESET ADDRESS
1	0x0100053
2	0x0100063
4	0x0100083
5	0x0100093

communication-port-software reset (continued)

When used in conjunction with the communication-port direction pins and $\overline{\text{NMI}}$ bus-grant, an effective method of error detection and correction can be achieved. A subroutine showing how to reset communication port 1 is given in Figure 3.

```

; -----;
; RESET1:Flushes FIFOs data for communication port 1;
; -----;
RESET1 push  AR0          ; Save registers
      push  R0           ;
      push  RC           ;
      ldhi  010h,AR0     ; Set AR0 to base address of COM 1
      or   050h,AR0     ;
FLUSH: rpts  1           ; Flush FIFO data with back-to-back write
      sti  R0,*+AR0(3)  ;
      rpts  10          ; Wait
      nop                ;
      ldi  *+AR0(0),R0  ; Check for new data from other port
      and  01FE0h,R0    ;
      bnz  FLUSH        ;
      pop  RC           ; Restore registers
      pop  R0           ;
      pop  AR0          ;
      rets                ; Return

```

Figure 3. Example of Communication-Port-Software Reset

$\overline{\text{NMI}}$ with bus-grant feature

The C44 devices have a software-configurable feature that allows forcing the internal-peripheral bus ready when the $\overline{\text{NMI}}$ signal is asserted. The $\overline{\text{NMI}}$ bus-grant feature is enabled when bits 19 and 18 of the status register (ST) are set to 10b. When enabled, a peripheral bus-grant signal is generated on the falling edge of $\overline{\text{NMI}}$. If $\overline{\text{NMI}}$ is asserted and this feature is not enabled, the CPU stalls on access to the peripheral bus if it is not ready. A stall condition occurs when writing to a full output FIFO or reading an empty input FIFO. This feature is useful in correcting communication-port errors when used in conjunction with the communication-port software-reset feature.

IDLE2 clock-stop power-down mode

The C44 has a clock-stop mode, or power-down mode (IDLE2) to achieve extremely low power consumption. When an IDLE2 instruction is executed, the clocks are halted with H1 held high. (Exiting IDLE2 requires asserting one of the $\overline{\text{IIOF3}}$ – $\overline{\text{IIOF0}}$ pins configured as an external interrupt.) A macro showing how to generate the IDLE2 opcode is given in Figure 4. During this power-down mode:

- No instructions are executed.
- The CPU, peripherals, and internal memory retain their previous state.
- The external-bus outputs are idle. The address lines remain in their previous state; the data lines are in the high-impedance state; and the output-control signals are inactive.

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

IDLE2 clock-stop power-down mode (continued)

```

; -----;
; IDLE2: Macro to generate idle2 opcode ;
; -----;
IDLE2      .macro
           .word      06000001h
           .endm

```

Figure 4. Example Software Subroutine Using IDLE2

IDLE2 is exited when one of the five external interrupts ($\overline{\text{NMI}}$ and $\overline{\text{IIOF3}}$ – $\overline{\text{IIOF0}}$) is asserted low for at least four input clocks (two H1 cycles). The clocks then start after a delay of two input clocks (one H1 cycle). The clocks can start in the opposite phase; that is, H1 can be high when H3 was high before the clocks were stopped. However, the H1 and H3 clocks remain 180 degrees out of phase with each other.

During IDLE2 operation, an external interrupt can be recognized and serviced by the CPU if it is enabled before entering IDLE2 and asserted for at least two H1 cycles. For the processor to recognize only one interrupt, the interrupt pin must be configured for edge-trigger mode or asserted less than three cycles in level-trigger mode. Any external interrupt pin can wake up the device from IDLE2, but for the CPU to recognize that interrupt, it must also be enabled. If an interrupt is recognized and executed by the CPU, the instruction following the IDLE2 instruction is not executed until after a return opcode is executed.

When the device is in emulation mode, the CPU executes an IDLE2 instruction as if it were an IDLE instruction. The clocks continue to run for correct operation of the emulator.

boot-loader mode selection

Table 3. Boot-Loader Mode Selection Using Pins $\overline{\text{IIOF3}}$ – $\overline{\text{IIOF0}}$

EXTERNAL PIN				SOURCE PROGRAM LOCATION
$\overline{\text{IIOF3}}$	$\overline{\text{IIOF2}}$	$\overline{\text{IIOF1}}$	$\overline{\text{IIOF0}}$	
1	1	0	1	Load source program from address 0030 0000h
1	0	1	1	Load source program from address 4000 0000h (see Note 1)
1	0	0	1	Load source program from address 80 0000h
0	1	1	1	Load source program from address 8000 0000h (see Note 2)
0	1	0	1	Load source program from address 8040 0000h (see Note 3)
0	0	1	1	Load source program from address 8080 0000h (see Note 4)
0	0	0	1	Reserved (boot-loader program terminates)
1	1	1	1	Load source program from communication port

- NOTES: 1. This selection cause the C44 to drive 0 in the 24 external local address pins and activates the $\overline{\text{LSTRB0}}$ signal.
2. This selection cause the C44 to drive 0 in the 24 external global address pins ando activates the $\overline{\text{STRB0}}$ signal.
3. This selection cause the C44 to drive 0x40 0000 in the 24 external global address pins and activates the $\overline{\text{STRB0}}$ signal.
4. This selection cause the C44 to drive 0x80 0000 in the 24 external global address pins and to activate the $\overline{\text{STRB0}}$ signal.

development tools

A key aspect to a parallel-processing implementation is the development tools available. The C44 is supported by a host of parallel-processing tools for developing and simulating code easily and for debugging parallel-processing systems. The code-generation tools include:

- An optimizing ANSI C compiler with a runtime-support library that supports use of communication ports and DMA
- Third party support for C, C++, and Ada compilers
- Several operating systems available for parallel-processing support as well as DMA and communication-port drivers
- Assembler and linker with support for mapping program and data to parallel processors

The simulation tools include a TI software-simulator with a high-level-language debugger interface for simulating a single processor. The hardware development and verification tools consist of the XDS510™ (parallel-processor in-circuit emulator and high-level-language debugger).

absolute maximum ratings over specified temperature range (unless otherwise noted)[†]

Supply voltage range, V_{DD} (see Note 5)	– 0.3 V to 7 V
Input voltage range	– 0.3 V to 7 V
Output voltage range	– 0.3 V to 7 V
Operating case temperature range, T_C : (PDB and GFW commercial temperature parts)	0°C to 85°C
(GFWA industrial temperature parts) [‡]	– 40°C to 115°C
Storage temperature range, T_{stg}	– 55°C to 150°C

[†] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

[‡] Assuming C44 nominal power consumption (350 mA) and given the C44 thermal characteristics, the maximum T_C corresponds to 85°C

NOTE 5: All voltage values are with respect to V_{SS} .

recommended operating conditions

		MIN	NOM [§]	MAX	UNIT	
V_{DD}	Supply voltage (DDV _{DD} , etc.)	4.75	5	5.25	V	
V_{IH}	High-level input voltage	X2 / CLKIN		$V_{DD} + 0.3$	V	
		\overline{CSTRB} and CRDY pins	2.4	$V_{DD} + 0.3$		
		All other pins	2	$V_{DD} + 0.3$		
V_{IL}	Low-level input voltage	– 0.3		0.8	V	
I_{OH}	High-level output current			– 300	μA	
I_{OL}	Low-level output current			2	mA	
T_C	Operating case temperature	PDB and GFW (commercial)		0	85	°C
		GFWA (industrial)		– 40	115	

[§] All typical values are at $V_{DD} = 5$ V, T_A (air temperature) = 25°C.

electrical characteristics over recommended ranges of supply voltage and operating case temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS [¶]		MIN	TYP [#]	MAX	UNIT
V_{OH}	High-level output voltage	$V_{DD} = \text{MIN}, I_{OH} = \text{MAX}$		2.4	3		V
V_{OL}	Low-level output voltage	$V_{DD} = \text{MIN}, I_{OL} = \text{MAX}$			0.3	0.6	V
I_Z	High-impedance current	$V_{DD} = \text{MAX}$		– 20		20	μA
I_I	Input current	X2/CLKIN only	$V_I = V_{SS} \text{ to } V_{DD}$	– 30		30	μA
		Inputs with internal pullups (see Note 6)		– 400		20	
		All others		– 10		10	
I_{CC}	Supply current	$T_A = 25^\circ\text{C}, V_{DD} = \text{MAX}, f_x = \text{MAX}$ (see Note 7)	C44-40		350	850	mA
			C44-50				
			C44-60		350	950	
C_I	Input capacitance					15	pF
C_O	Output capacitance					15	pF

[¶] For conditions shown as MIN/MAX, use the appropriate value specified under recommended operating conditions.

[#] All typical values are at $V_{DD} = 3.3$ V, T_A (air temperature) = 25°C.

NOTES: 6. Pins with internal pullup devices: TDI, TCK, TMS. Pin with internal pulldown device: \overline{TRST} .

7. f_x is the input clock frequency. The maximum value (max) for the C44-40, C44-50, and C44-60 is 40, 50 and 60 MHz, respectively.

PARAMETER MEASUREMENT INFORMATION

Where: I_{OL} = 2 mA (all outputs)
 I_{OH} = 300 μ A (all outputs)
 V_{LOAD} = 2.15 V
 C_T = 80 pF typical load-circuit capacitance

Figure 5. Test Load Circuit

signal transition levels

TTL-level outputs are driven to a minimum logic-high level of 2.4 V and to a maximum logic-low level of 0.6 V. Output transition times are specified as follows:

- For a low-to-high transition, the level at which the output is said to be no longer low is 1 V and the level at which the output is said to be high is 2 V.
- For a high-to-low transition on a TTL-compatible output signal, the level at which the output is said to be no longer high is 2 V and the level at which the output is said to be low is 1 V.

Figure 6. TTL-Level Outputs

Transition times for TTL-compatible inputs are specified as follows:

- For a low-to-high transition on an input signal, the level at which the input is said to be no longer low is 0.92 V (10%) and the level at which the input is said to be high is 1.88 V (90%).
- For a high-to-low transition on an input signal, the level at which the input is said to be no longer high is 1.88 V (90%) and the level at which the input is said to be low is 0.92 V (10%).

Figure 7. TTL-Level Inputs

PARAMETER MEASUREMENT INFORMATION

timing parameter symbology

Timing parameter symbols used herein were created in accordance with JEDEC Standard 100. In order to shorten the symbols, pin names that have both global and local applications are generally represented with (L) immediately preceding the basic signal name (for example, (L)RDY represents both the global term RDY and local term LRDY). Other pin names and related terminology have been abbreviated as follows, unless otherwise noted:

A	(L)A23 – (L)A0 or (L)Ax	IACK	$\overline{\text{IACK}}$
AE	$\overline{\text{(L)AE}}$	IF	$\overline{\text{IIOF(3-0)}}$ or $\overline{\text{IIOF}x}$
ASYNCH	Asynchronous reset signals in the high-impedance state	IIOF	$\overline{\text{IIOF(3-0)}}$ or $\overline{\text{IIOF}x}$
BYTE	Byte transfer	LOCK	$\overline{\text{(L)LOCK}}$
CA	$\overline{\text{CACK(1,2,4,5)}}$ or $\overline{\text{CACK}x}$	P	$t_{c(H)}$
CD	C(1,2,4,5)D7 – C(1,2,4,5)D0 or CxDx	PAGE	(L)PAGE0 and (L)PAGE1 or (L)PAGEx
CDIR	CDIR(1,2,4,5) or CDIRx	RDY	$\overline{\text{(L)RDY0}}$, $\overline{\text{(L)RDY1}}$, or $\overline{\text{(L)RDY}x}$
CE	$\overline{\text{(L)CE0}}$, $\overline{\text{(L)CE1}}$, or $\overline{\text{(L)CE}x}$	RESET	RESET
CI	CLKIN	RW	(L)R/ $\overline{\text{W0}}$, (L)R/ $\overline{\text{W1}}$, or (L)R/ $\overline{\text{W}x}$
COMM	Asynchronous reset signals	S	$\overline{\text{(L)STRB0}}$, $\overline{\text{(L)STRB1}}$, or $\overline{\text{(L)STRB}x}$
CONTROL	Control signals	ST	(L)STAT3 – (L)STAT0 or (L)STATx
CRQ	$\overline{\text{CREQ(1,2,4,5)}}$ or $\overline{\text{CREQ}x}$	TCK	TCK
CRDY	$\overline{\text{CRDY(1,2,4,5)}}$ or $\overline{\text{CRDY}x}$	TCLK	TCLK0, TCLK1, or TCLKx
CS	$\overline{\text{CSTRB(1,2,4,5)}}$ or $\overline{\text{CSTRB}x}$	TDO	TDO
D	(L)D31 – (L)D0 or (L)Dx	TMS	TMS/TDI
DE	$\overline{\text{(L)DE}}$	WORD	32-bit word transfer
H	H1, H3

11	$t_{d}(H1H-CDIRL)$ Delay time,		9		9	ns
12	$t_{d}(H1H-CDIRH)$ Delay time,		9		9	ns

- NOTES: A. Asynchronous reset signals that go to a high logic level after $\overline{\text{RESET}}$ returns to a high state include $\overline{\text{CREQ}}_y$, $\overline{\text{CACK}}_x$, $\overline{\text{CSTRB}}_x$, and $\overline{\text{CRDY}}_y$ (where $x = 1$ or 2 and $y = 4$ or 5).
- B. $\overline{\text{RESET}}$ is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle can occur.
- C. For this diagram, (L)Dx includes D31 - D0, LD31 - LD0, and CxD7 - CxD0; (L)Ax includes LA(23 - 0) and A(23 - 0).
- D. Control signals $\overline{\text{LSTRB}}_0$, $\overline{\text{LSTRB}}_1$, $\overline{\text{STRB}}_0$, $\overline{\text{STRB}}_1$, (L)STAT3 - (L)STAT0, (L)LOCK, (L)R/W0, and (L)R/W1 go high while (L)PAGE0 and (L)PAGE1 go low.
- E. Asynchronous reset signals that go into the high-impedance state after RESET goes low include TCLK0, TCLK1, IIOF3 - IIOF0, and the communication-port control signals $\overline{\text{CREQ}}_x$, $\overline{\text{CACK}}_y$, $\overline{\text{CSTRB}}_y$, and $\overline{\text{CRDY}}_x$ (where $x = 1$ or 2 , and $y = 4$ or 5). At reset, ports 1 and 2 become outputs, and ports 4 and 5 become inputs.
- F. $x = 1$ or 2 and $y = 4$ or 5

Figure 20. RESET Timing

timing for $\overline{\text{IIOF}}_x$ interrupt response [$P = t_{c(H)}$] (see Notes 9 and 10 and Figure 21)

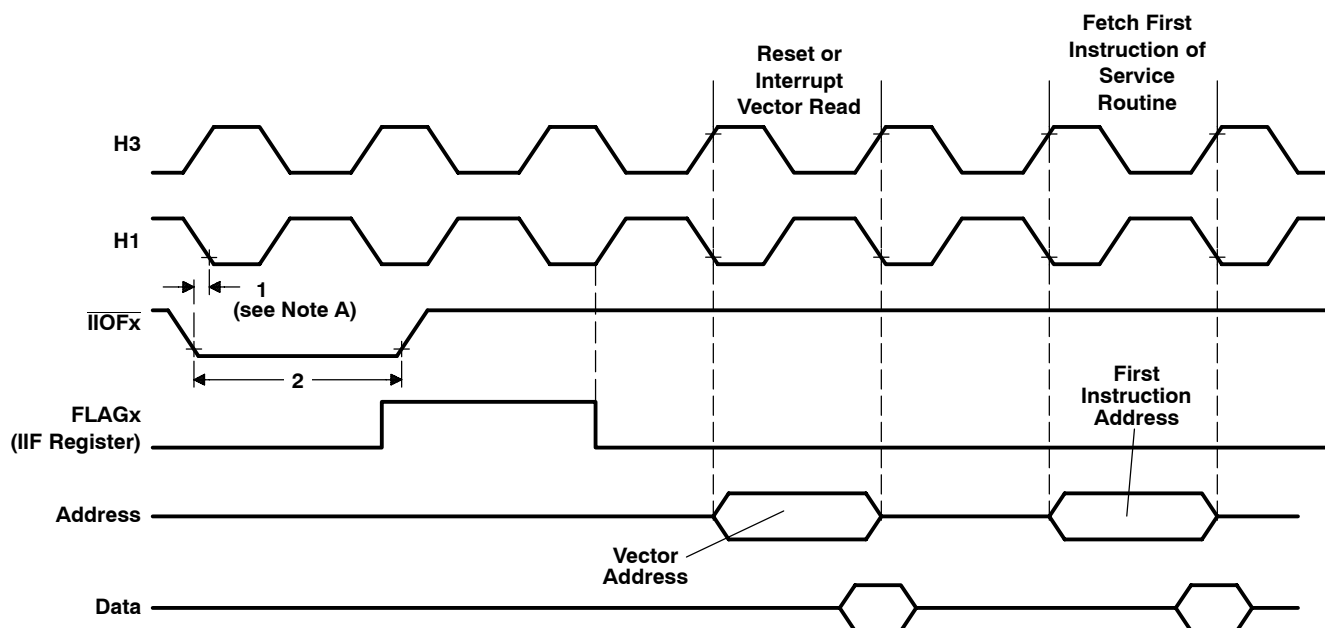

NO.		TMS320C44-50			TMS320C44-60			UNIT
		MIN	TYP	MAX	MIN	TYP	MAX	
1	$t_{su}(\overline{\text{IIOF}}\text{-H1L})$ Setup time, $\overline{\text{IIOF}}_x$ before H1 low	11 [†]			11 [†]			ns
2	$t_w(\text{INT})$ Pulse duration, to assure one interrupt seen (see Note 11)	P	1.5 P	2 P	P	1.5 P	2 P	ns

[†] If this timing is not met, the interrupt is recognized in the next cycle.

NOTES: 9. $\overline{\text{IIOF}}_x$ is an asynchronous input and can be asserted at any point during a clock cycle. If the specified timings are met, the exact sequence shown occurs; otherwise, an additional delay of one clock cycle can occur.

10. Edge-triggered interrupts require a setup of time (1) and a minimum duration of P. No maximum duration limit exists.

11. Level-triggered interrupts require interrupt-pulse duration of at least 1 P wide (P = one H1 period) to ensure it will be seen. It must be \leq to 2 P wide to ensure it will be responded to only once. Recommended pulse duration is 1.5 P.

NOTE A: The C44 can accept an interrupt from the same source every two H1 clock cycles.

Figure 21. $\overline{\text{IIOF}}_x$ Interrupt-Response Timing [$P = t_{c(H)}$]

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

timing for $\overline{\text{IACK}}$ (see Note 12 and Figure 22)

NO.		TMS320C44-50		TMS320C44-60		UNIT
		MIN	MAX	MIN	MAX	
1	$t_{d(H1L - \overline{\text{IACKL}})}$ Delay time, H1 low to $\overline{\text{IACK}}$ low		9		7	ns
2	$t_{d(H1L - \overline{\text{IACKH}})}$ Delay time, H1 low to $\overline{\text{IACK}}$ high during first cycle of IACK instruction data read		9		7	ns

NOTE 12: The $\overline{\text{IACK}}$ output is active for the entire duration of the bus cycle and is, therefore, extended if the bus cycle utilizes wait states.

Figure 22. $\overline{\text{IACK}}$ Timing

communication-port word-transfer-cycle timing[†] [P = t_{c(H)}] (see Note 13 and Figure 23)

NO.		TMS320C44-50		TMS320C44-60		UNIT
		MIN	MAX	MIN	MAX	
1	t _{c(WORD)} [‡] Cycle time, word transfer (4 bytes = 1 word)	1.5 P + 7	2.5 P + 170	1.5 P + 7	2.5 P + 170	ns
2	t _{d(CRDYL-CSL)W} Delay time, CRDYx low to CSTRBx low between back-to-back write cycles	1.5 P + 7	2.5 P + 28	1.5 P + 7	2.5 P + 28	ns

[†] For these timing values, it is assumed that the C4x receiving data is ready to receive data. Line propagation delay is not considered.

[‡] t_{c(WORD)} max = 2.5 P + 28 ns + the maximum summed values of 4 × t_{d(CSL-CRDYL)R}, 3 × t_{d(CRDYL-CSH)}, 3 × t_{d(CSH-CRDYH)R}, and 3 × t_{d(CRDYH-CSL)W} as seen in Figure 24. This timing assumes two C4xs are connected.

NOTE 13: These timings apply only to two communicating C4xs. When a non-C4x device communicates with a C44, timings can be longer. No restriction exists in this case on how slow the transfer could be except when using early silicon (C40 PG 1.x or 2.x). Refer to the CSTRB width restriction section of the *TMS320C4x User's Guide* (literature number SPRU063).

 = When signal is an input (clear = when signal is an output).

[†] Begins byte 0 of the next word.

NOTE A: For correct operation during token exchange, the two communicating C4xs must have CLKIN frequencies within a factor of 2 of each other (in other words, at most, one of the C4xs can be twice as fast as the other).

Figure 23. Communication-Port Word-Transfer-Cycle Timing [P = t_{c(H)}]

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

1	$t_{su(CD-CSL)W}$ Setup time, CxDx valid before \overline{CSTRBx} low (write)	2		2		ns
2	$t_{d(CRDYL-CSH)W}$ Delay time, \overline{CRDYx} low to \overline{CSTRBx} high (write)	0	12	0	12	ns
3	$t_{h(CRDYL-CD)W}$ Hold time, CxDx after \overline{CRDYx} low (write)	2		2		ns
4	$t_{d(CRDYH-CSL)W}$ Delay time, \overline{CRDYx} high to \overline{CSTRBx} low for subsequent bytes (write)	0	12	0	12	ns
5	$t_{c(BYTE)}^\dagger$ Cycle time, byte transfer		44		44	ns
6	$t_{d(CSL-CRDYL)R}$ Delay time, \overline{CSTRBx} low to \overline{CRDYx} low (read)	0	10	0	10	ns
7	$t_{su(CSL-CD)R}$ Setup time, CxDx valid after \overline{CSTRBx} low (read)	0		0		ns
8	$t_{h(CRDYL-CD)R}$ Hold time, CxDx valid after \overline{CRDYx} low (read)	2		2		ns
9	$t_{d(CSH-CRDYH)R}$ Delay time, \overline{CSTRBx} high to \overline{CRDYx} high (read)	0	10	0	10	ns

$^\dagger t_{c(BYTE)} \text{ max} = \text{summed maximum values of } t_{d(CRDY-CSH)}, t_{d(CSL-CRDYL)R}, t_{d(CSH-CRDYH)R}, \text{ and } t_{d(CRDYH-CSL)W}. \text{ This assumes two C4xs are connected.}$

NOTE 14: Communication port timing does not include line length delay.

 = When signal is an input (clear = when signal is an output).

Figure 24. Communication-Port Byte-Cycle Timing (Write and Read)

timing for communication-token transfer sequence, input to an output port [$P = t_{c(H)}$]
(see Figure 25)

NO.		MIN	MAX	UNIT
1	$t_{d(CAL-CS)T}^\dagger$ Delay time, \overline{CACKx} low to \overline{CSTRBx} change from input to a high-level output	$0.5 P + 6$	$1.5 P + 22$	ns
2	$t_{d(CAL-CRQH)T}^\dagger$ Delay time, \overline{CACKx} low to start of \overline{CREQx} going high for token-request acknowledge	$P + 5$	$2 P + 22$	ns
3	$t_{d(CRQH-CRQ)T}$ Delay time, start of \overline{CREQx} going high to \overline{CREQx} change from output to an input	$0.5 P - 5$	$0.5 P + 13$	ns
4	$t_{d(CRQH-CA)T}$ Delay time, start of \overline{CREQx} going high to \overline{CACKx} change from an input- to an output-level high	$0.5 P - 5$	$0.5 P + 13$	ns
4.1	$t_{d(CRQH-CD)T}$ Delay time, start of \overline{CREQx} going high to $CxDx$ change from input-driven to output-driven	$0.5 P - 5$	$0.5 P + 13$	ns
4.2	$t_{d(CRQH-CRDY)T}$ Delay time, start of \overline{CREQx} going high to \overline{CRDYx} change from an output to an input	$0.5 P - 5$	$0.5 P + 13$	ns
5	$t_{d(CRQH-CSL)T}$ Delay time, start of \overline{CREQx} going high to \overline{CSTRBx} low for start of word-transfer out	$1.5 P - 8$	$1.5 P + 9$	ns
6	$t_{d(CRDYL-CSL)T}$ Delay time, \overline{CRDYx} low at end of word-input to \overline{CSTRBx} low for word-output	$3.5 P + 12$	$5.5 P + 48$	ns
7	$t_{d(CRQH-CDIRL)}$ Delay time, \overline{CREQx} high to $CDIRx$ low, change from input to output	$0.5 P - 5$	$0.5 P + 13$	ns

[†] These timing parameters result from synchronizer delays and are referenced from the falling edge of H1. The inputs (that cause the output-signal pins to change values) are sampled on H1 falling. The minimum delay occurs when the input condition occurs just before H1 falling, and the maximum delay occurs when the input condition occurs just after H1 falling.

NOTE A: Before the token exchange, \overline{CREQx} and \overline{CRDYx} are output signals asserted by the C44 receiving data. \overline{CACKx} , \overline{CSTRBx} , and $CxD7 - CxD0$ are input signals asserted by the device sending data to the C44; these are asynchronous with respect to the H1 clock of the receiving C44. After token exchange, \overline{CACKx} , \overline{CSTRBx} , and $CxD7 - CxD0$ become output signals, and \overline{CREQx} and \overline{CRDYx} become inputs.

Figure 25. Communication-Token Transfer Sequence, Input to an Output Port [$P = t_{c(H)}$]

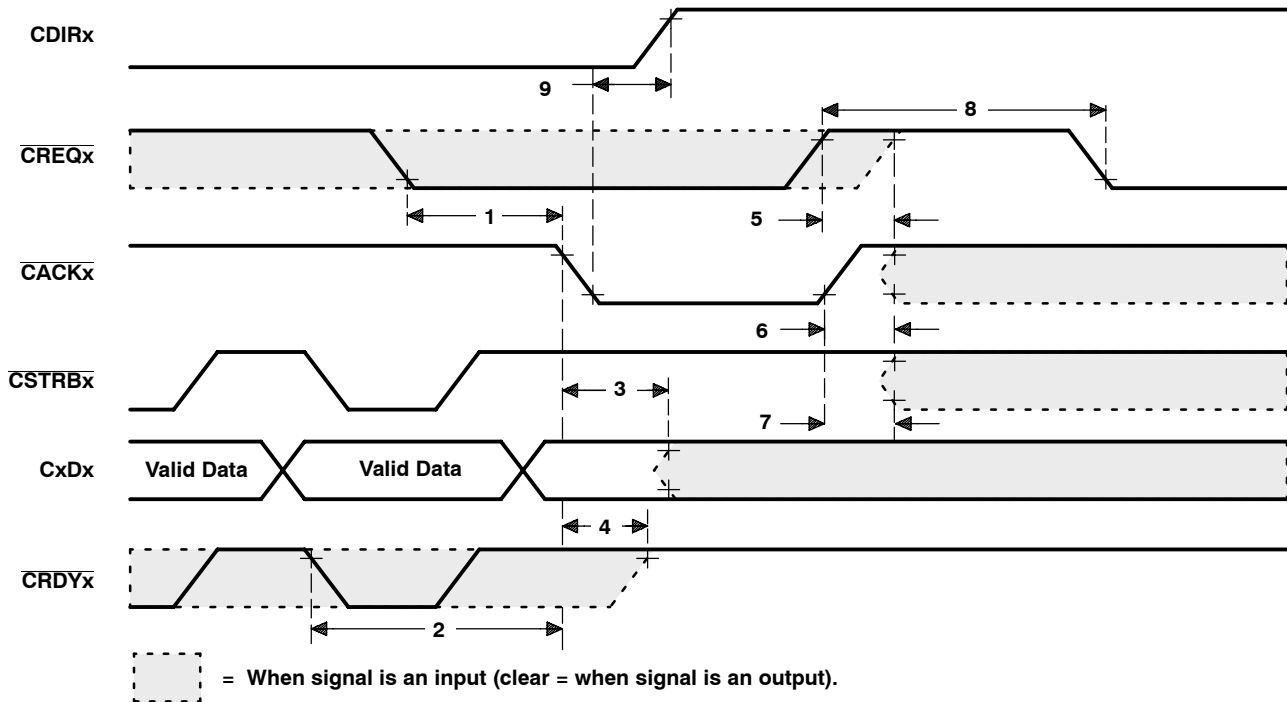

TMS320C44 DIGITAL SIGNAL PROCESSOR

SPRS031C – AUGUST 1994 – REVISED MARCH 2004

timing for communication-token transfer sequence, output to an input port [$P = t_{c(H)}$] (see Figure 26)

NO.		MIN	MAX	UNIT
1	$t_{d(CRQL-CAL)T}^{\dagger}$	Delay time, \overline{CREQx} low to start of \overline{CACKx} going low for token-request-acknowledge		ns
2	$t_{d(CRDYL-CAL)T}^{\dagger}$	Delay time, \overline{CRDYx} low at end of word-transfer out to start of \overline{CACKx} going low		ns
3	$t_{d(CAL-CDI)I}$	Delay time, start of \overline{CACKx} going low to CxDx change from outputs to inputs		ns
4	$t_{d(CAL-CRDY)T}$	Delay time, start of \overline{CACKx} going low to \overline{CRDYx} change from an input to output, high level		ns
5	$t_{d(CRQH-CRQ)T}^{\dagger}$	Delay time, \overline{CREQx} high to \overline{CREQx} change from an input to output, high level		ns
6	$t_{d(CRQH-CA)T}^{\dagger}$	Delay time, \overline{CREQx} high to \overline{CACKx} change from output to an input		ns
7	$t_{d(CRQH-CS)T}^{\dagger}$	Delay time, \overline{CREQx} high to \overline{CSTRBx} change from output to an input		ns
8	$t_{d(CRQH-CRQL)T}^{\dagger}$	Delay time, \overline{CREQx} high to \overline{CREQx} low for the next token-request		ns
9	$t_{d(CAL-CDIRH)}$	Delay time, \overline{CACKx} low to CDIRx high, change from output to input		ns

[†] These timing parameters result from synchronizer delays and are referenced from the falling edge of H1. The inputs (that cause the output-signal pins to change values) are sampled on H1 falling. The minimum delay occurs when the input condition occurs just before H1 falling, and the maximum delay occurs when the input condition occurs just after H1 falling.

NOTE A: Before the token exchange, \overline{CACKx} , \overline{CSTRBx} , and CxD7 – CxD0 are asserted by the C44 sending data. \overline{CREQx} and \overline{CRDYx} are input signals asserted by the C44 receiving data and are asynchronous with respect to the H1 clock of the sending C44. After token exchange, \overline{CREQx} and \overline{CRDYx} become outputs, and \overline{CSTRBx} , \overline{CACKx} , and CxD7 – CxD0 become inputs.

TMS320C44GFW50	NRND	BGA	GFW	388		TBD	Call TI	Call TI		TMS320C44GFW @1990 TI 50	
TMS320C44GFWA	NRND	BGA	GFW	388		TBD	Call TI	Call TI		TMS320C44GFW @1990 TI A	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
